/note="Weetcr: PWD4Znv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomoleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
cf pWD42 (gi|4732114|gb|AR129072.1), a copy.number
inducible derivative of plasmid R1. The vector was ligated
with adaptores complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli XLIO-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwast, a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/clone lib="Mouse 10kb plasmid UngClM library"
/note="Vector: PWA2INV; Purified genomic DNA from M.
musculus GSTBL/GJ (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orilice at constant velocity. The Bheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high mollar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWA2 (gil473214) [gb] ARI29072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for amplicillin resistance."

Imboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AP129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;

Suzuki,Y., Yoshitomo-Nakagawa,K., Maruyama,K., Suyama,A. and Sugano,S. Construction and characterization of a full length-enriched and a 5'-end-enriched cDNA library. Gene 200 (1-2), 149-156 (1997).
Trimming: cross match from University of Washingtion Genome Center PHRAP suite. Poly-T Identification: parMatch.pl from Berkeley brosophila Genome Project. University of Washingtion Genome Center: http://www.genome.washington.edu Low Quality Sequence: 8 contiguous PHRED high quality bases following vector sequence. Very Low Quality Sequence: Trace file contained 15 contiguous distinct peaks following vector sequence. Polyadenylation: Based upon the presence of a XhoI site followed by a run of 14 or more T residues at the beginning of the sequence, this cDNA insert was polyadenylated. High quality sequence stop: 8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase and T4 polymerase and T4 polymerase and T4 polymerase hydrodynamicalide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis Vector DNA was prepared from a derivative of pND42 (gi|4732114 [gb|AFL29072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AW248457

Directionally cloned into EcoRI/KioI sites using the following 5' adaptor: GGCACGG(G). Size=selected >500bp for average insert size 1: Rkb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies)."
www-bio.llnl.gov/bbrp/image/image.html Base Calling / Quality Scores: PRRED from University of Washingtion Genome Center. Trimming: cross_match from University of Washingtion Genome Center PRRAP suite. Poly-T identification: patwatch.pl from Berkeley Drosophila Genome Project. University of Washingtion Genome Center: http://www.penome.washington.edu Low Quality Sequence: 16 contiguous PRRED high quality bases following vector sequence. Very Low Quality Sequence: Trace file contained is contiguous distinct peaks following vector sequence. Polyadenylation: Based upon the presence of a XhoI site followed by a run of 14 or more T residues at the beginning of the sequence, this cDNA insert was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

Scores: BHRED from University of Washingtion Genome Center. Vector
Trimming: cross match from University of Washingtion Genome Center.
Drosophila Genome Project. University of Washingtion Genome Center:
phrap suite. Poly-r Identification: patMatch.pl from Berkeley
thtp://www.genome.washington.edu Low Quality Sequence: 6 contiguous
phrap high quality bases following vector sequence. Very Low
Quality Sequence: Trace file contained 15 contiguous distinct peaks
following vector sequence. Polyadenylation: Based upon the presence
of a XhoI site followed by a run of 14 or more T residues at the
beginning of the sequence, this cDNA insert was polyadenylated.
                                                                                                                                                                                                                                            contiguous PHRED high quality bases following vector sequence. Very low Quality Sequence: Trace file contained 16 contiguous distinct peaks following vector sequence. Polyademylation: Based upon the presence of a Xho1 site followed by a trun of 14 or more T residues at the beginning of the sequence, this cDNA insert was polyademylated.

Hong/Rubin Laboratory CDNA Library Frequency Frequencing Frogramment: DCIPLIF CDNA LIBRARY Frequency Frequencing project Clone distribution: MGC colone distribution information can be found through the I.M.A.G.E. Consortium(LIMLN at: www-bio.llnl.gov/bbrp/image/image.html Base Calling / Quality Scores: PRRED From University of Washingtion Genome Center. Vector Trimming: cross match from University of Mashingtion Genome Center. PRRAP suite. Poly-T Identification: patMatch.pl from Berkeley Drosophila Genome Project. University of Mashingtion Genome Center. PHRAP suite. Poly-T Identification: patMatch.pl from Berkeley Drosophila Genome Project. University of Mashingtion Genome Center. http://www.genome.washington.edu Low Quality Sequence: 6 contiguous PHRED high quality bases following vector sequence. Very Low Quality Sequence: Trace file contained 15 contiguous distinct peaks following vector sequence. Polyadenylation: Based upon the presence of a XhoI site followed by a run of 14 or more T residues at the beginning of the sequence, this cDNA insert was polyadenylated. Plate: LLCM10 row: D column: 5
High quality sequence stop: 6
